SMART PEOPLE

"The thing about smart people is that they seem like crazy people to dumb people."

SURGEONS

“Washing hands and organizing surgical tools wastes a lot of time. I could help more patients if I just dove in.”

BUILDERS

“We know how skyscrapers work. Just give us some bricks and we’ll get started.”

THE PROBLEM

Is it a people problem? Is it a process problem?

PROFESSIONALS

Design, plan, and prepare.

Then do the work.

- ▶ Software teams must agree on benefit
 - ▶ Each individual must be on board
 - ▶ Accountability and professionalism
- ▶ Testing is a mind-set
 - ▶ Know and understand the benefits
- ▶ Long-term approach
 - ▶ It is practiced daily
 - ▶ It is a chosen developer lifestyle
 - ▶ “No more riding solo...”

PEOPLE

- ▶ Produces better results faster
 - ▶ Use a plan.
- ▶ Process is the difference between:
 - ▶ Surgery and cutting people open
 - ▶ Software Engineering and “programming”
- ▶ Doesn't matter if you are self-taught or not
 - ▶ We all need to have a proper process.
- ▶ Why should we test? Any benefits?

PROCESS

- ▶ Effectiveness is an outcome of good process.
- ▶ Stability is an outcome of good process.
- ▶ Successful people use good processes.
- ▶ Chaos is an outcome of bad process, not people.

PEOPLE & PROCESS TOGETHER

EXCUSES

Why we do not test or use TDD?

- ▶ Not enough time to do it right the first time
- ▶ Fix later not now mentality...we'll come back when we have time
- ▶ The architecture/design doesn't promote unit testing.
- ▶ What are some other reasons?

EXCUSES FOR NOT TESTING

NO PROCESS OUTCOME

What is the result or outcome when a process is not followed?

- ▶ What Is Debt?
 - ▶ Accumulates over time
 - ▶ Compounds
 - ▶ Bites you, when you least expect it
- ▶ Bugs and Defects
- ▶ Orthogonal, Fragile software
- ▶ Architectural: High degree of Coupling and Dependencies
- ▶ Lack of Accountability, Professionalism, or Craftsmanship

TECHNICAL DEBT...

TDD TO THE RESCUE

How can a TDD process help?

- ▶ Higher Quality software now, not later
- ▶ Faster development, Flawless Deployments
- ▶ Lower cost
- ▶ Lower maintenance
 - ▶ Less or no bugs
 - ▶ Easier to add new features
- ▶ Pay-as-you-go Plan
 - ▶ Regular Payments
 - ▶ Pay down existing debt
- ▶ Measurable, quantifiable results

TDD PROVIDES

- ▶ Design and plan before you code
- ▶ Documents your design – How it works.
- ▶ Proof that code implements the design
- ▶ Encourages the design of testable code!

TDD...PRACTICAL RESULTS

A decorative graphic consisting of several parallel white lines of varying lengths, slanted upwards from left to right, located in the bottom right corner of the slide.

TDD :: WHERE TO START

The image features a solid blue background with a gradient from light blue at the top to a darker blue at the bottom. In the lower-left quadrant, the text "TDD :: WHERE TO START" is written in a white, sans-serif font. In the bottom-right corner, there are several white, parallel diagonal lines of varying lengths, creating a sense of motion or a modern design element.

- ▶ What is design?
- ▶ How much design?
- ▶ Who, what, when, where, and how?
 - ▶ Understanding the domain...the what – decompose.
 - ▶ Relationships
 - ▶ Separation of concerns
 - ▶ Single responsibility
- ▶ Take time to design or think
 - ▶ Defines how to implement
 - ▶ Continuous design...or design-as-you-go

DESIGN

- ▶ You have been asked to create software for a new pop machine that will have a more intuitive user interface and interact with social media – in addition to the typical pop machine behaviors.
- ▶ The new design should make use of mobile technology to manage product selections, payment, and tracking soda-points for users – so a user can have a more interactive experience. Your team is responsible for the software.
- ▶ The web site and mobile application will be developed by a different company – and will integrate with your services.

POP MACHINE DESIGN

- ▶ Test initial design
- ▶ Start small
- ▶ Tracer-bullet (integration-like)
 - ▶ aim for the target early and adjust
 - ▶ Full stack test early
- ▶ Identify goals of the system/solution
 - ▶ MVP (minimal viable product)
 - ▶ Focus on the core features first – edge cases last
- ▶ Initial tests fail...failure is expected?

TEST

- ▶ Initial tests fail – without implementation
- ▶ Define end-points of your solution
 - ▶ entry points (layers, tiers, and domain)
 - ▶ Service APIs, Business Logic, Data Access → Tests
- ▶ Implement interfaces or abstractions early
 - ▶ May refactor later – when domain is more understandable
- ▶ How will I test this?
 - ▶ Principles: Separation of Concerns & Single Responsibility
 - ▶ Test should target something specific and quantifiable

IMPLEMENT

- ▶ Happy path testing
 - ▶ Expected result(s) :: right results are quantifiable
- ▶ Alternative testing
 - ▶ Boundaries :: use {correct}
 - ▶ Inverse relationships :: {insert-retrieve}
 - ▶ Cross-check results :: {different algorithm}
 - ▶ error conditions :: force them
 - ▶ Performance considerations

TEST...MORE

A decorative graphic consisting of several parallel white lines of varying lengths, slanted upwards from left to right, located in the bottom right corner of the slide.

- ▶ Conformance
- ▶ Ordering
- ▶ Range
- ▶ Reference
- ▶ Existence
- ▶ Cardinality
- ▶ Time

BOUNDARY TESTING

- ▶ Definition: repetitious or frequent, repeating
- ▶ How?
 - ▶ modify and improve on each iteration
 - ▶ Add more tests
 - ▶ Or modify existing tests
 - ▶ Test each iteration until desired outcome

ITERATIVE DEVELOPMENT

TEST AUTOMATION

Why and how?

- ▶ Write once, run frequently
- ▶ Eliminates human input (less error prone)
 - ▶ Doesn't forget steps – just runs test
- ▶ Quantifiable results
 - ▶ Reportable to development team
 - ▶ Result notifications
 - ▶ Track and measure over time
- ▶ Safety net: during development, QA, and deployments

WHY AUTOMATE?

- ▶ Testing framework (i.e., NUnit)
 - ▶ Common tool for whole team
 - ▶ Projects and organization
- ▶ Test repository
 - ▶ Location to store tests
 - ▶ Tests are a valuable resource to protect
- ▶ Continuous integration (cruisecontrol.net)

TOOLS

TESTING SCENARIOS

NEW DEVELOPMENT

Where to start?

- ▶ Start with test project or test fixture
- ▶ Use tests to drive development process

TEST BEFORE CODE

DEFECTS AND LEGACY CODE

- ▶ Refactor code and modify tests
- ▶ Validate results with unit tests

DEFECTS

- ▶ Locate
- ▶ Reproduce defect

- ▶ Improve and standardize

LEGACY CODE

TEST COVERAGE

- ▶ Goal: Continuous Improvement over time

COVERAGE

TEST TYPES

UNIT TESTS

- ▶ Definition: 1. an individual thing regarded as single and complete but which can also form an individual component of a larger or more complex whole.
- ▶ The intent of the test should be evident (name, structure, focus)
- ▶ Isolatable
- ▶ Can be targetable (public, private)
 - ▶ Business logic
 - ▶ Business rule
 - ▶ Data validation
 - ▶ Result specific
 - ▶ quantifiable

WHAT IS A UNIT

- ▶ Inputs
 - ▶ Data and parameters
- ▶ Output
 - ▶ Validate via Assertions
- ▶ Dependencies
 - ▶ Abstractions and interfaces
 - ▶ Injected?
- ▶ Controlled dependencies
 - ▶ Stubs or mocks
- ▶ Modular and decoupled

UNIT TEST :: INPUTS AND DEPENDENCIES

INTEGRATION TESTS

- ▶ **Integration testing** (sometimes called **integration and testing**, abbreviated **I&T**) is the phase in software testing in which individual software modules are combined and tested as a group. It occurs after unit testing and before validation testing.
- ▶ Integration testing takes as its input modules that have been unit tested, groups them in larger aggregates, applies tests defined in an integration test plan to those aggregates, and delivers as its output the integrated system ready for system testing.

DEFINITION OF INTEGRATION TEST

- ▶ Service API Testing
 - ▶ Includes the business logic and data access modules
- ▶ Data Access
 - ▶ Includes manipulation of the application's database.

INTEGRATION EXAMPLES

FUNCTIONAL TESTS

- ▶ **Functional testing** is a quality assurance (QA) process ^{[1] [2]} and a type of black box testing that bases its test cases on the specifications of the software component under test. Functions are tested by feeding them input and examining the output, and internal program structure is rarely considered (not like in white-box testing).^[3] Functional Testing usually describes *what* the system does.
- ▶ Functional testing differs from system testing in that functional testing "verifies a program by checking it against ... design document(s) or specification(s)", while system testing "validate[s] a program by checking it against the published user or system requirements" (Kaner, Falk, Nguyen 1999, p. 52).

FUNCTIONAL TEST DEFINITION

PATTERNS

Design Patterns and Principles that support TDD.

A series of several parallel white lines of varying thicknesses, slanted diagonally from the bottom-left towards the top-right, located in the right half of the slide.

SERVICE FACADE PATTERN

- ▶ Definition: A single class that represents an entire subsystem.
- ▶ Useful in API design
- ▶ Useful in Service Oriented Architectures (SOA)
- ▶ Typically implements an *Interface*
- ▶ Unit tests will be more *integration* in nature – exercise the full implementation (full stack).

FAÇADE PATTERN

PROVIDER PATTERN

Ability to design loosely coupled components. The design patterns at work are: Strategy and Abstract Factory.

BUSINESS ACTIONS

Implement business logic using classes instead of methods to take advantage of Object-Oriented behaviors and techniques. Allows for implementation of base classes for common behavior and property data. Enables the use of abstractions.

TEMPLATE METHOD PATTERN

Allows you to create or define an algorithm (process, steps, flow) that can be redefined in implementation and at runtime.

REPOSITORY PATTERN

Use a repository to separate the logic that retrieves the data and maps it to the entity model from the business logic that acts on the model. The business logic should be agnostic to the type of data that comprises the data source layer. For example, the data source layer can be a database, a SharePoint list, or a Web service.
